

SCENAR TECHNOLOGY

SCENAR - an acronym for Self Controlling Energy Neuro Adapting Regulator - is universally recognised as an ideal electrotherapy. Reading the skin, it provides up to date informational data about the inner structures and organs within the body.

Using electric pulses shaped like a nerve pulse, SCENAR activates the body's self healing and energy reserves. "In simple terms, it's like an intelligent TENS machine and it speeds up the healing process." comments Emma Hawthorne of Flawborough Equine.

Veterinary surgeon Roger Meacock specialises in treating animals using cutting edge medical technology such as Scenar. "Many of the cases I take on are those

Roger Meacock, MRCVS

where more conventional options are offering little hope, are inappropriate or not desired" says Roger.

"All healing takes place naturally, treatment simply tries to make nature's job easier. This may be achieved by surgical closure of a wound so that the two sides can heal across or by trying to influence the body's biochemistry in some way to facilitate overall function.

"I work with horses that are competing internationally - including the recent Beijing Olympics - and with family ponies!" says Roger whose techniques can be used to maintain health and optimise performance.
